TITLE: Sintering of graphite powders during chemical heat treatment with carbide-forming elements

SOURCE: Poroshkovaya metallurgiya, no. 3, 1966, 37-41

TOPIC TAGS: graphite, powder metal sintering, metal diffusion plating, metal surface impregnation, chromium, titanium, titanium compound, powder metallurgy

ABSTRACT: Chromizing and titanium impregnation of graphite powders of various granulometric composition and of compressed graphite blanks are discussed. The kinetics involved in obtaining chromium carbide coatings on graphite is examined. The possibility of obtaining titanium carbide coatings is shown. The main factors affecting the depth of coating and the sinterability of carbidized powders are established. Plasticizers, such as rubber solution in gasoline, have no effect on impregnation kinetics. [Based on author's abstract.] [NT]

AUTHOR: Shestakov, A.T.

TITLE: Determination of the edge temperatures of rotor cylinders during asynchronous starting of machines with solid rotors

PERIODICAL: Referativnyy zhurnal, Elektrotehnika i energetika, no.11, 1961, 25, abstract 111 191. (Vestn. elektroprom-sti no.6, 1961, 29-30)

TEXT: A procedure of calculation has been developed which allows for the distribution of current over the thickness of the surface layer of the rotor that results from the current constriction effect. The instantaneous value of the heat evolved in the surface layer of thickness x of a rotor cylinder is given by the formula:

$$Q_x = 0.24 \int_0^t \left(\frac{M_c s n_0}{0.975} + \frac{GD^2 n}{3600} \cdot \frac{dn}{dt} \right) (1 - e^{-2kx}) dt,$$

Card 1/ 2

Determination of the edge temperatures... S/196/61/000/011/028/042
E194/E155

where: M_0 - the static load torque, kg.m; s - slip;
 n_0 - synchronous speed, r.p.m., GD^2 - flywheel torque of system,
kg m²; l - rotor length, cm; $k = \sqrt{\omega p / 2 \rho}$ - p - the angular
speed of the rotor, radians/sec; μ - the magnetic permeability
of the rotor steel in which changes during the starting time are
negligible, ρ - the specific resistance of the rotor steel,
ohm mm²/m. The method was used to determine the surface layer
temperature for a motor type CTM-1500-2 (STM-1500-2) for a pump
type 14N12 x 2 (14N12 x 2) with a total flywheel torque of
0.29 T m². The thickness of the surface layer was taken to be
0.5 cm, the calculated temperature was 103° and the test
temperature 90 °C. ✓

TITLE: On the Problem of Flameless Combustion of Natural Gas
(K voprosu o besplamennom szhiganii prirodnogo gaza)

PERIODICAL: Sb. nauchn. tr. Kuybyshevsk. industr. in-ta, 1957,
Nr 7, pp 149-156

ABSTRACT: Flameless combustion reduces to a minimum the chemical and mechanical unburned loss, air excess, reduces the losses from q_2 , raises the average temperature gradient, reduces furnace size, etc. Among its disadvantages are reduction of direct heat transfer and narrowing the range of stable gas burning along with an increase of the primary-air share. To ensure stable combustion, gas-air mixture is considerably preheated, or combustion stabilizers are used, or the direct heat transfer from the combustion zone is reduced. For burning naphthenic hydrocarbons (natural gases), which burn

Card 1/2

11(2)

SOV/112-59-3-4444

On the Problem of Flameless Combustion of Natural Gas

with much more difficulty than simple gases (CO , H_2 , C_2H_2), a careful gas-air premixing is necessary, as well as a preheating of gas-air mixture and cutting of air excess down to zero. Visible flame is mostly a result of unburned loss of the fuel mass. In burning the natural gas from Pokhvistnevo-Buguruslan fields, the following values were investigated: optimum theoretical combustion temperature, average effective furnace temperature, degree of screening, blackness of the flame (α_f). The limit α_f 0.182 is not lower than for other types of fuel.

Letter to the Editor:

1962, Geokhimiya, no. 3, 1962, 540

In an amplification of a previous paper (Geokhimiya, no. 1, 1961) it was shown that in the case of simultaneous loss of Pb and U(Th) from a mineral the total effect must be calculable from the equation:

$$\ln \frac{C}{C_0} = \ln \left(\frac{C}{C_0} \right) - 1 - \frac{(1-n)/(1-m)}{(1-n)/(1-m)} (\exp(-\lambda T) - \exp(-\lambda T))$$
, whence an equation for $^{207}\text{Pb}/^{235}\text{U}$ can be derived. If the loss factors for lead and uranium (thorium) are equal (i. e., with $n = m$) this becomes $\ln \frac{C}{C_0} = \exp(-\lambda T) - 1$. These conclusions and the related diagrams in the previously-mentioned paper can be used only to compare two minerals, one without loss of lead and the other without loss of uranium (thorium).

TEXT: An analysis is made of the processes occurring in a block-
ing-oscillator utilizing the saturation of a junction transistor
triode. It is shown that the parameters of the triode have little
effect on the pulse shape. From the analysis of comparatively sim-
ple equivalent circuits the relationships between the pulse para-
meters and repetition-frequency is derived. Possible configura-
tions of the blocking oscillator circuit are discussed. The dis-
crepancy between the calculated and experimental pulse shape does
not exceed 15 to 30% (in many cases 2 - 5%) for the currents range
from 10 mA to 8 amp and for pulse durations from 5 to 2000 microsec.

TITLE: The effect produced by the type of ions upon the character
of the change in the electrical properties of a semi-
conductor surface during its irradiation by ions of medium
energy

PERIODICAL: Fizika tverdogo tela, v. 3, no. 1, 1961, 267-274

TEXT: The effect produced by ion bombardment upon the surface properties
of semiconductors has hitherto not been sufficiently investigated; above
all, nothing is known about the effect produced by the type of ions, i. e.,
the most contradictory opinions have been expressed (Refs. 2 and 4). A
study of these questions is of both basic and practical value. If, e.g.,
the effect of bombardment does not depend on the type of ions, the effect
would have to be considered to be purely microthermal, and in the
opposite case, to be microchemical. Experiments, described in earlier

papers uniquely proved that different effects are produced by different ions. The present paper deals with a study of the volt-ampere characteristics of W-Ge and W-Si point contacts in the irradiation with atomic oxygen ions and molecular nitrogen ions of 5 and 10 lev. The experimental conditions were chosen in such a manner that an answer to the especially interesting questions (change in carrier mobility, carrier concentration of the scattering centers) could be expected. Theoretical considerations in this direction are discussed in detail; they led to the conclusion that an investigation of the volt-ampere characteristics of point contacts (investigation of direct and reverse currents and of the rectification constant between semiconductor and metal may supply the required information in a bombardment with ions of 5-10 kev. The radiation dose was varied within the range of from 10^{11} - 10^{15} ions/cm². The experiments were carried out by means of the mass separator described in Ref. 3. The ion source was gaseous (impact ionization); the irradiated specimens were n-type Ge and Si single crystals with a concentration ratio of the carriers of $n/n_0 = 1 \cdot 10^{-9}$ and $7 \cdot 10^{-9}$, respectively. The individual measurements were repeated with due

B102/B204

frequency in order to keep the statistical error at a minimum. The results were evaluated according to M. O. Kornfel'd. Measurements are illustrated in Figs. 3 and 4. Fig. 3 shows the ratio of the rectification constant after irradiation to its value before irradiation as a function of the radiation dose for 5- and 10-kev ions. The difference between the effect of O and N₂ ions is obvious. Whereas N₂ ions do not change the carrier concentration considerably and increase the defect density only slightly (thus somewhat increasing the ohmic resistance), O ions increase the rectification constant (i.e., by forming a p-n junction in the "active zone" of the specimens, because the penetrating oxygen atoms act as acceptors). The rectification constant has a maximum at a certain dose (which is due either to a removal of the region of defect-carrier equilibrium from the active zone of the probe, or to an increase of the lattice defects, or to both). Fig. 4 shows the dependence of direct and reverse currents and rectification constant on the radiation dose N₀ (irradiation by 10-kev O and N₂ ions). The true value lies in the hatched region. There are 4 figures, 1 table, and 10 references: 5 Soviet-bloc and 5 non-Soviet-bloc.

Title : Agro-meliorative Characteristics of Small River Valley Soils
in the Central Part of the Moldavian SSR

Orig. No : Izv. Mold. Fil. AN SSSR, 1957, No 9, (42), 59-71

Abstract : The findings are set forth of a study of the properties of low-fertility soils in the bottom lands of small rivers: flood-land-marsh, meadow-marsh, flood-land-solonchak, flood-land-meadow and chernozem soils. Described are the morphology of the soils, the hydro-physical properties, the content of humus, CO₂ and water-soluble salts in the soils. The ordinary chernozems, meadow chernozems and meadow soils are recommended for use in growing vegetables and fodder crops. In order to bring into cultivation the muddy-marsh and meadow-marsh solonchak soils with near ground waters it is recommended that they be drained. The meadow solonchaks and

TITLE: The problem of hydraulic similarity of centrifugal pumps

SOURCE: Lopatochnyye mashiny i struynyye apparaty (Vane machinery and jet apparatus); sbornik statey, no. 1. Moscow, Izd-vo Mashinostroyeniye, 1966, 204-216

TOPIC TAGS: centrifugal pump, fuel supply, fuel pump, *HYDRAULICS*

ABSTRACT: The designs of high-hydraulic-head, high-capacity centrifugal pumps and the conditions under which experiments with pump models and at reduced velocities can be used by designers are investigated. It was assumed that, under certain conditions, there is a flow similarity in pumps at different circumferential velocities as well as with geometrically similar changes in the pump dimensions. Experiments were conducted with seven centrifugal and axial-centrifugal pumps of various parameters (inlet diameters, 0.4—0.7; impeller-blade exit angle, 20—55°; five blades; critical speeds 50—150). The effects of the circumferential velocity of the centrifugal impeller and the effect of the absolute pump dimensions on pump parameters were studied. The following results were obtained: 1) Dimensionless hydraulic-head characteristics of the pumps did not change during operation at various rpm as well as with geometrically similar changes in pump dimensions at $Re \geq 0.3 \cdot 10^6$ in the

TITLE: Method for manufacturing articles with variable cross section. Class 7,
No. 188454

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 25

TOPIC TAGS: cold rolling, variable cross section article, ~~article cold rolling~~
fabricated structural metal

ABSTRACT: This Author Certificate introduces a method for manufacturing articles with variable cross section by cold rolling of a stationary blank with two undriven rolls. To improve the dimensional accuracy and the surface quality of the article the blank is rotated after each working cycle around the longitudinal axis for a programmed angle and the amount of feed is automatically changed.

TITLE: Control formulae for gas analysis. (Kontrol'nye formuly dlya gazovogo analiza)

PERIODICAL: Teploenergetika, 1958, No.6. pp. 90-91 (USSR)

ABSTRACT: If a gas analysis is made at several successive sections in the gas flow, a certain formula is commonly recommended for use in checking that the results are consistent. This brief note proposes certain modifications to this formula. It is claimed that, in verifying the correctness of selection of gas sampling points and in checking the accuracy of analyses, the modified formula obviates preliminary determinations of the characteristics of the fuel or the CO content of the combustion products.

TITLE: Compressed Air Blowing of Liquid Metal in Heavy-duty Open-hearth Furnaces (Vduvaniye kompressornogo vozdukha v zhidkuyu vannu bol'shegruznykh martenovskikh pechey)

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Chernaya metallurgiya, 1958,
Nr 2 pp 34 47

ABSTRACT: A report on the results of 40 experimental smeltings carried out in the 390-ton open-hearth furnaces of the KMK (Kuznetsk Metallurgical Kombinat). Compressed air at a pressure of 3.5-5.0 atm gage was introduced into the hearth at a rate of 2500-2800 m³/hr by means of two water-cooled tuyeres installed in the crown of the furnace. The blowing commenced 1-1.5 hrs prior to melting and terminated at the beginning or the midpoint of the pure "boil" period. In the course of the experimental smeltings, the rate of decarbonization became considerably faster, the dephosphorization process more efficient, and the content of FeO in the slag increased by 6% at the end of the

Compressed Air Blowing of Liquid Metal in Heavy-duty Open-hearth (cont.)

melting stage. Instead of 1.0-1.5°C/min, as in the case of a standard smelting process, the temperature of the metal increased at a rate of 2.0-2.5°C/min. this made it possible to reduce the consumption of conventional fuel by an average of 7 kg per ton of ingots. In the process the degree of utilization of O₂ contained in the compressed air by the molten metal is increased by a factor of 4-8 owing to the increased supply O₂ from the atmosphere of the furnace. Compressed-air blowing at a pressure of 5.5 atm gage is equivalent in efficiency to blowing with pure O₂. The duration of a 390-ton melting process was reduced by 38 minutes on the average. The amount of dust being evolved during blowing does not exceed 1 g/m³. No noticeable wear was observed in the furnace lining. Overoxidation of metal in the course of the blowing process was absent; at the same time the content of N amounted to only 0.0033%. The finished metal contains H, O, N, and slag inclusions in quantities analogous to those contained in standard metals. Mechanical properties of the steel were not impaired.

TITLE We Shall Exceed the Plan by 7000 Tons of Steel.
(Dadim sverkh plana 7000 tonn stali.- Russian)

PERIODICAL Metallurg 1957, Vol 2, Nr 4, pp 13 - 15 (USSR)
Received: 5/1957 Reviewed: 7/1957

ABSTRACT 1932 saw the delivery of the first melt of the Martin furnace
Nr 1; our combine supplied the basic construction areas of the
Five-Year-Plans with iron metals. These years were also years
of learning the complicated steel melting methods for the former
construction workers of the combine who have remained here
as metallurgical workers. They have succeeded in steadily in-
creasing the output of steel by better organization of produc-
tion, utilization of existent capacities, application of most
recent techniques in furnace construction and heat technology,
change of working methods, qualitative improvements, shortening
of interruptions with an additional increase of the furnace
path of the Martin furnaces. This was publicly recognized
several times by the competent central authorities. In order
to improve the charging, the loading capacity of the charging
boxes was increased, and it will reach 1.75 m³ by 1957. Together

with the use of cruder scrap this will lead to a shortening of the duration of charging and thus also of the duration of melting. Greater boxes, however, also necessitate a strengthening of the means of charging. Since 1949, a change has been started from silica vaults to basic magnesite-chromite vaults, in 1953 the transition to bar suspended vaults was completed which resulted in a great prolongation of the life span of the Martin furnaces. This change made it possible to increase the heat intensity. Here it was necessary to strengthen the air ducts, and for this purpose the smokestacks were made higher, the blast was mounted on the same shaft as the engine, and the vacuum was increased to a pressure of 10 mm water column. The high temperatures made it necessary to strengthen lower part of the furnace, particularly the air mountings, the upper rows of which were made out of forsterite (fireproof material). In order to obtain a better distribution in the burner and a better utilization of the fuel, compression air is blown into the gas caisson in all furnaces, which brings about a sharp reduction in the consumption of gas. The personnel of the combine carried out together with the Central Laboratory and the Siberian Metallurgical Institute an extensive research program for the improvement

CARD 2/4

We Shall Exceed the Plan by 7000 Tons of Steel. PA-3056

of steel melting, for the reduction of the duration of melting, and for savings of raw and auxiliary materials: experiments of deoxidation of rail steel without blast furnace iron silicon, deoxidation of boiling steels in the evaporating boiler, melting of weakly alloyed metal in the large charging furnace, etc. Work towards qualitative improvement led to a sharp reduction of waste (47 % in 1956 as compared to 1951). 720,000 rubles of net costs were saved in 1956. In 1951-56 the system of suggestions existing in the combine resulted in 718 used suggestions which saved 4,500,000 rubles. The melting of dynamo steel was simplified by deoxidizing it in the boiler rather than in the furnace. The work at the hearth accretion was mechanized, dephosphorization was changed. Together with the growth of the combine, an increase took place also in the number of those persons who were promoted from subsidiary to higher and more responsible positions. In 1957, the combine faces complicated tasks: The plan for January 1957 was not fulfilled. The reason for this will be found in the unsatisfactory

supplies of good ores and scrap. This state of affairs must be improved; also more efficient packing presses for light scrap must be installed.
